PAYROLL OPERATIONS

Catching payroll errors before the client does

Client: An Italian payroll provider sending payslips for three clients and 122 employees under the CCNL Terziario, with errors planted on purpose.

> **Which payslips are wrong before they go out, by how much, and what does the November 2026 pay increase cost each client?**

35 of 35	6	€212.40	€2,379.98
planted errors found, with no false alarms	employees below the minimum: €175.44 a month plus arrears	less withholding tax in one F24 than the payslips add up to	a month to pay in November 2026, after absorption

WHAT I DID

- Wrote fourteen checks that recompute each item from the collective agreement's rules, not from the payroll software: minimums, seniority steps, INPS, TFR, holidays, 13th and 14th month, leavers, notice.
- Reconciled the F24 tax payment with the sum of each client's payslips.
- Delivered the checks three ways that agree: Python, a live-formula sheet for Google Sheets and a browser tool in English and Italian.

WHAT IT FOUND

- Three of six leavers carry an error: the 14th month counted from January, untaken holiday paid at 1/30, a dismissal with half the notice the agreement requires.
- Each flag comes with the expected value, the value found and what to do.

WITH REAL DATA

- A pilot on one client's real payslips, run in the browser so the files never leave the office.
- The other collective agreements the provider's clients apply.
- A monthly record of what the checks caught, to measure the errors avoided.

How it is checked. The sheet checked against Python on 580 values; the browser tool on 2,219 values, half-cent alterations and Italian file formats included; every rule with its source in the agreement.
