REWARD

From family pay bands to one range per grade and country

Client: The same four-country employer, paying through bands built family by family, with one head-office scale cut down by a fixed share for each country.

> **Our bands pay the family, not the job. What should equal-value ranges look like, what will the move cost, and what do we publish in job ads?**

39%
Tech's midpoint above Customer Service's at the same level

−9.7% to +13.6%
payroll against the market, Germany to Poland

€3.02M
a year to bring 824 people to the new minimum, 58% of it for women

€3.48M
a year of pay protected for 739 people above the maximum

WHAT I DID

- Measured how far the current bands pay the family rather than the grade of equal value.
- Priced one range per grade and country on Eurostat market data for the same occupations.
- Placed every employee against the new range, costing who falls below the minimum and who sits above the maximum.
- Built a range finder that gives recruiters the range to publish for any vacancy (Article 5).

WHAT IT FOUND

- Inside one grade of equal value, midpoints differ by up to 74%.
- The bands put Poland at 81% of Italy; the market puts it at 66%. In Italy 42% of women fall below the new minimum against 26% of men.

WITH REAL DATA

- A salary survey (Mercer, WTW, Korn Ferry) in place of Eurostat's averages.
- The job evaluation agreed with workers' representatives before the ranges are set.
- A phased plan, with the protected pay brought into range over two or three reviews.

How it is checked. 1,315 figures reconciled between the Excel formulas and pandas, recalculated by LibreOffice on every change; every market figure traced to its Eurostat table.

Pay structures · Market pricing · Compa-ratio · Excel modelling · Python
